

ABSTRACT OF THE DISCLOSURE

Under the knowledge which two kinds of intracellular signal transfer mechanism of TGF - β super family receptor exist: a pathway via Smad molecule and a pathway via novel 5 MAP kinase such as TAB1 and TAK1, and the knowledge of interaction of Smad molecule with intranuclear receptor or CBP/p300 on the transcription control by Smad molecule, a screening method and a molecular designing method for pharmaceuticals with identified site of action and higher 10 specificity can be accomplished.

TAK1 TAB1 Smad CBP/p300
